

642-067 exam questions accompanied by exhibits

Verified Answers Researched by Industry Experts and almost 100% correct

642-067 exam questions updated on regular basis

Same type as the certification exams, 642-067 exam preparation is in multiple-choice questions (MCQs).

Tested by multiple times before publishing

Try free 642-067 exam demo before you decide to buy it in Test-Inside.com.

Note: This pdf demo do not include the question's picture.

Exam : Cisco 642-067

Title : Advanced Routing and Switching for Field Engineers

1. Which three of the following steps are mandatory when configuring MPLS on Cisco IOS? (Choose three.)

- A. start LDP
- B. enable CEF switching
- C. configure the MPLS ID
- D. disable IP TTL propagation
- E. configure conditional label advertising
- F. enable label switching on frame mode interfaces

Answer: ABF

2. How are RIP routing contexts implemented in MPLS VPN?

- A. RIP does not support routing contexts
- B. routing contexts are implemented in a single routing process
- C. routing contexts are implemented using multiple routing processes
- D. routing contexts are implemented as several instances of a single routing process
- E. routing contexts are implemented as a single instance of several routing processes

Answer: D

3. Which of the following statements about authentication responses and conditions is true? (Choose two.)

- A. When a router receives a failure response, it stops querying authentication methods.
- B. When a router receives an error response, it stops querying authentication methods.
- C. If the router receives a failure response from an authentication method, it queries the next method.
- D. The router does not differentiate between failure and error responses; the authentication process is always interrupted.
- E. If it receives no response from the authentication method, a router will determine the error condition on its own; the router also has the option to proceed to the next method in a list if configured accordingly.

Answer: AE

4. Which two of the following statements are true about HSRP load sharing? (Choose two)

- A. It is achieved by using more than one HSRP group.
- B. It is done in regards to either round robin or weight basis.
- C. It is used to offload the active router in a certain HSRP group.
- D. Single group HSRP is used to achieve more efficient link utilization.
- E. The return traffic is influenced by HSRP load sharing configuration.

Answer: AC

5. Why is it appropriate to use conditional label advertising when deploying MPLS?

- A. to make CEF tables smaller
- B. to enable label switching on the frame mode interface
- C. to restrict MPLS availability to predefined time periods

- D. to restrict label switching to a limited number of networks
- E. to restrict end users from seeing the routers in the MPLS network

Answer: D
